# Black Lacquer Pipe

Be aware that using steel with thick protective coatings such as these may result in **additional** stripping or sandblasting charges.

Some of these lacquers are near impossible to strip in the caustic pickling process. Although we extend our processing time to compensate, it doesn't always work.

## When choosing and welding your pipe:

- Ask for weathered pipe. The UV will have assisted to break down the coating.
- Prep any welds by clearing the area by a **minimum 20mm**. Welding on or near the coating will carbonise it and render the pickling process ineffective.

**REMEMBER: The quality of the steel does matter.**
